

Exposed terminals in the distribution box

Overview

The terminals are where the wires connect to the distribution box. The required barrier ensures that no energized terminal is exposed to inadvertent contact by people or equipment while servicing load terminals in the panelboard. Inside, you'll find parts like circuit breakers and fuses that protect the system from problems like overloads and short circuits. It ensures that electricity flows. Both the Occupational Safety and Health Administration (OSHA) and the National Fire Protection Association (NFPA) require the insulation and protection of wiring energized at 50 volts or higher if the wiring is equal to or below eight feet off the ground. Let's begin with InterNACHI's Home Inspection Standards of Practice. The box usually contains switches, fuses, or.

Exposed terminals in the distribution box

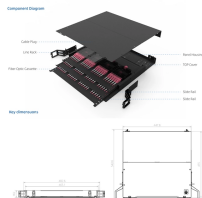

Where equipment grounding conductors of the wire type enter a panelboard metal cabinet, they must terminate to a grounding terminal bar within the panelboard metal cabinet frame [Sec. 408.40].

The required barrier ensures that no energized terminal is exposed to inadvertent contact by people or equipment while servicing load terminals in the panelboard.
