

How are optical modules configured

Overview

An optical module typically consists of an optical transmitter (TOSA, Transmitter Optical Sub-Assembly, containing a laser diode), an optical receiver (ROSA, Receiver Optical Sub-Assembly, containing a photodetector), functional circuits, and optical (electrical) interfaces. This chapter describes how to configure the Optical Amplifier Module and Protection Switching Module (PSM). For. Optical modules are electronic devices that convert electrical signals into optical signals for transmitting data over an optical fiber. Composition of Optical Modules The optical module, known as Optical Transceiver in. Integrated circuits and reference designs help you create a smaller and faster optical module design used in high-bandwidth data communication applications.
