

Introduction to SC Cold Joints

Overview

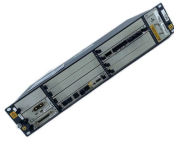

This typically happens due to delays in concrete placement, improper surface preparation, or inadequate curing of the initial layer. As you know, concrete hardens through chemical reactions between cement aggregate, water, and air. Whilst the hardening process is essential to ensure structure stiffness, it also significantly. Cold joint in concrete a structure can be occurred due to the lack of attention of the supervision team or unawareness of the setting time of the concrete. Question: When should saw cuts be made on a concrete slab?

The American Concrete Institute (ACI) is a leading authority and resource worldwide for the development and distribution of. In the world of construction, the term “cold joint” refers to a discontinuity in a concrete structure that occurs when one batch of concrete hardens before the next batch is placed, resulting in a weak bond between the layers. This can compromise the structural integrity, durability, and aesthetic.
