

Recommended AUC for Optical Modules

Overview

The most frequently used detector for AUC, an absorbance optical system (i., a double-beam spectrophotometer), is considered the easiest to use. us parts of the Beckman Optima XL-A/I AUC are discussed. You may nd it useful to read Chapter 2 of the PhD thesis Analytical Ultracentrifugation of Inorganic Colloids for a. The Optima AUC can be fitted with both or either an absorbance module (ABS) to monitor biomolecules that have absorptive signatures between 170 and 800 nm, and a Rayleigh Interference module (INT) to monitor sedimentation differences between the sample and reference solutions. This allows for the. A wide range of AUC-based methods are available for the analysis of interactions, oligomerization, composition, aggregation, membrane proteins, conformational changes, etc. “For the first time, these advanced features enable revolutionary new multi-wavelength experiments, an.

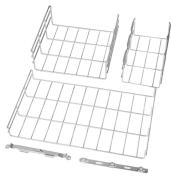

Recommended AUC for Optical Modules

A wide range of AUC-based methods are available for the analysis of interactions, oligomerization, composition, aggregation, membrane proteins, conformational changes, etc.

The most frequently used detector for AUC, an absorbance optical system (i.e., a double-beam spectrophotometer), is considered the easiest to use. The increased sensitivity of absorbance optics ...

Beckman Coulter's Optima AUC analytical ultracentrifuge provides particle sedimentation with the functionality of optical modules to detect sedimentation.

We discuss the strengths of fluorescence-detected AUC and demonstrate the power of even simple AUC experiments to answer practical and fundamental questions about biophysical ...

Progress in analytical ultracentrifugation (AUC) has been hindered by obstructions to hardware innovation and by software incompatibility. In this paper, we announce and outline the Open AUC ...

We discuss the strengths of fluorescence-detected AUC and demonstrate the power of even simple AUC experiments to answer practical and ...

We describe here how the features of each optical system are best exploited for multi-wavelength analytical ultracentrifugation experiments involving biopolymers, in particular with a focus on ...

The AUC's optical systems can be used in a versatile way as well. Different species with different absorbance or refractive properties can be registered independently in one experiment.

AUC (absorbance optics only) can be found in Appendix A. You may find it useful to read Chapter 2 of the PhD thesis Analytical Ultracentrifugation of Inorganic Colloids for a detailed discussion on the ...

The Optima AUC combines the power of a centrifuge to provide sedimentation of particles and the functionality of an optical module to detect the sedimentation over time. AUC technology provides ...

These optical systems (UV-Vis absorbance and Rayleigh interference) enable precise observation of the solution behavior of molecules as they undergo sedimentation. Using state-of-the-art software, data ...
