

## What are optical module communication products

### Overview

An optical module is a small device that moves data using light. It changes electrical signals into light signals and back again. This helps data travel faster and farther than with copper cables. Optical modules are very important for fast internet, cloud computing, and other. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Operating at the physical layer of the OSI model, optical modules are core devices in optical. um arsenide and indium phosphide technology platforms. With decades of field-proven reliability, these lasers will support the most mission-critical networks, from high-speed datacenters in the cloud, to the 5G optical access inf dules, optical monitoring modules, and passive optics.
