

What are the basic characteristics of network security devices

Overview

Network security devices are hardware or virtual appliances designed to protect computer networks from unauthorized access, data breaches, and cyberattacks. They include firewalls, intrusion prevention systems, VPN gateways, and other tools that safeguard data across network. Network Security devices are typically physical or virtualized hardware appliances, with vendor specific software installed. Occasionally, businesses purchase commodity server hardware and install custom software to create their own network security device. A key strategy in network security is the multi-layered defense. Explore essential security devices in networking with this beginner's guide, covering firewalls, VPNs, IDS, IPS, and more.
