

Where can I find the model number of the optical module

Overview

Execute the command "show interface interface-type interface-number transceiver" to view the basic information of the optical module on the interface. Knowing how to view SFP module details helps network engineers verify installation, monitor performance, troubleshoot issues, and maintain. Execute the following command to view detailed interface and optical module status: show interface <interface-type> <interface-number> The output includes interface rate, module type, link state (UP status is required for normal module operation), and traffic statistics, all of which assist in. An SFP module is a hot-swappable transceiver that converts electrical signals into optical (or electrical, in copper variants) signals. It enables flexible connectivity between networking devices and supports different speeds, wavelengths, and distances. Most Cisco optics also support Digital. When the optical module on an interface is faulty, you can run the display commands to view information about the optical module. Connector Figure 2-63 shows an SFP/eSFP optical module.
